## Wild Salmon Gutting Machine in Alaska

*KROMA sends their GUTMASTER 3000 for Wild Salmon Test in Alaska*

The Danish manufacturer of fish-processing equipment decides to send a demo machine to Alaska for Wild Salmon test between 1 and 4 kilos (2 and 9 lbs). The test will hold place at **Port Edward, British Columbia** in the first weeks of August and KROMA welcomes its audience to participate in this test and see with their eyes how their machine perform.

The GUTMASTER 3000 comes with the unique option to **change the pressure** of the tools. This is useful especially when the fish is in **rigor mortis**. Since the fish is not flexible during this period, **higher pressure** is required. This **can be adjusted** only by choosing high pressure on the **touch screen** of the machine. The same implies for the low pressure – when fish is softer.

In addition to that, the head cutter is unique and it has not been seen before. The tool is set-up in a way that can be adjusted to cut the head of the fish, choosing between **16 different sizes**. Everything can be done by choosing the fish size you want to cut the head off on the touch screen.
